Google Maps: Add a stop

Task: plan a walk to Taquería Mamut, then add The Home Depot and Metria Hotel as stops on the way and put them in order.

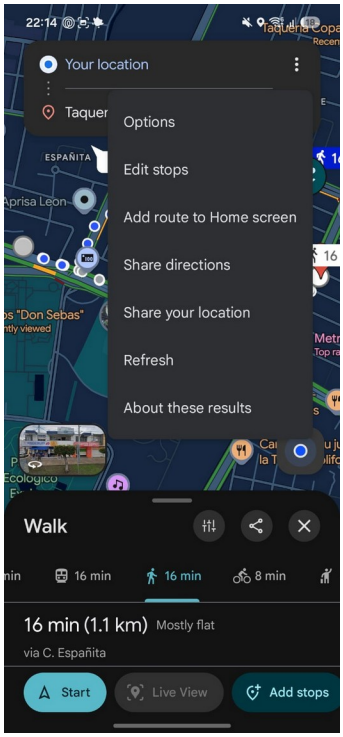

Current process

Current process: Route preview → ⋮ menu → Edit stops → Choose destination → Search and pick → Drag to reorder → Done

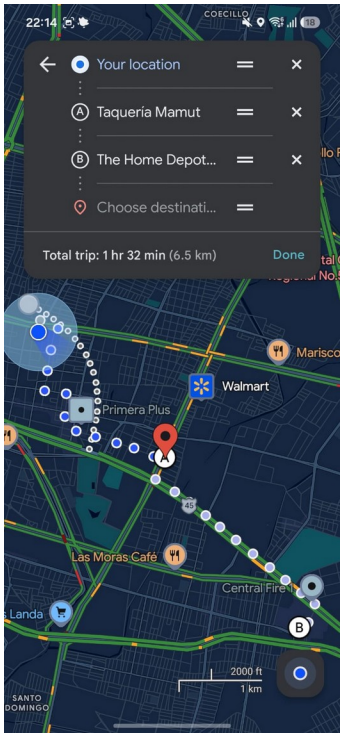

1. Route preview

The walk to Taquería Mamut takes 16 min. “Add stops” is cut off at the right edge of the bottom bar.

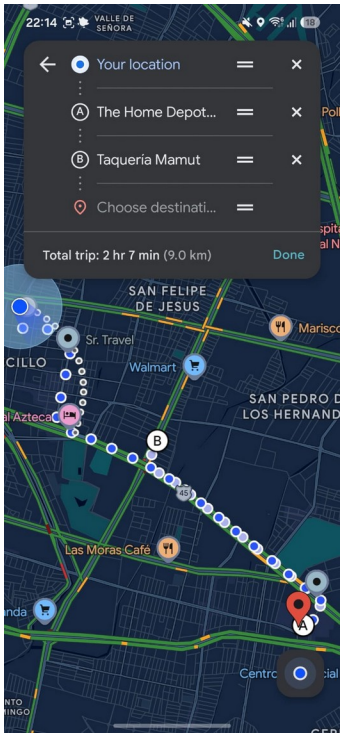

2. Three-dot menu

The option is called “Edit stops” and sits among seven unrelated actions.

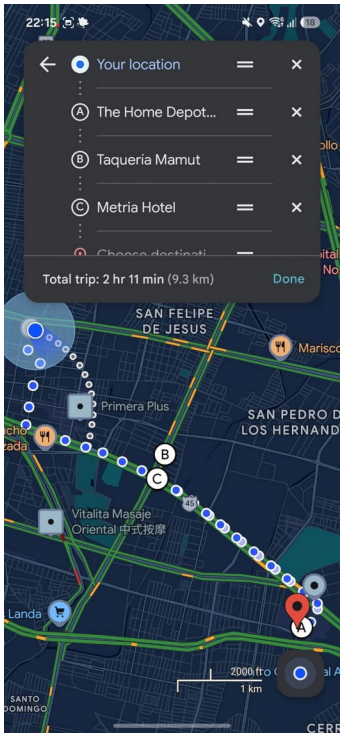

3. Edit stops

The Home Depot is added after the destination, so Taquería Mamut turns into stop A. Total: 1 hr 32 min.

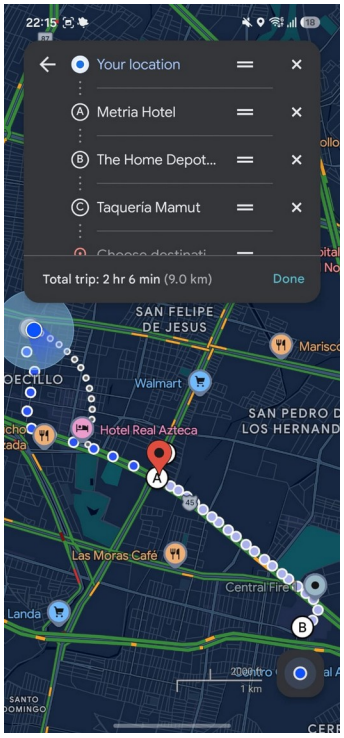

4. Drag to reorder

Swapping the two stops with the ≡ handle makes the trip 2 hr 7 min. There is no warning.

5. Add a third stop

Metria Hotel lands at the end as C, and an empty “Choose destination” field stays below it.

6. Reorder and Done

The final order gives 2 hr 6 min. Edit mode only ends when you tap Done.

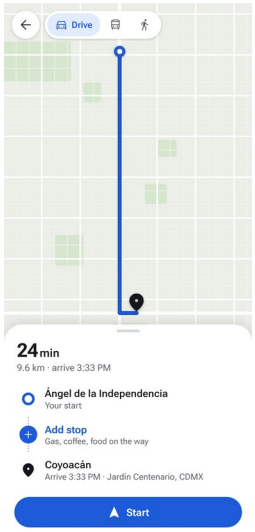

UX analysis

Adding a stop takes six screens and five to six actions: open the three-dot menu, tap Edit stops, tap the empty field, search the place, drag it into position and tap Done. The feature exists, but it is hard to find and the result is hard to trust. The “Add stops” button is cut off at the edge of the bottom bar, the menu calls it “Edit stops”, and every new place is added after the destination. The list never says how many minutes each place adds or which order is fastest: swapping two stops changed the trip from 1 hr 32 min to 2 hr 7 min without any warning.

- **How many steps?** Six screens, five to six actions for one stop.
- **Is the navigation clear?** Partly. The edit list looks like the route card; only “Done” tells you that you are editing.
- **Is the feature easy to find?** No. The button is cut off and the menu option is the second of seven.
- **Are the buttons easy to identify?** Partly. The ≡ handles and ✕ buttons are small and gray, and the empty “Choose destination” field looks required.
- **Is the information organized?** The list covers the top third of the map and only shows the total time, never the time per stop.

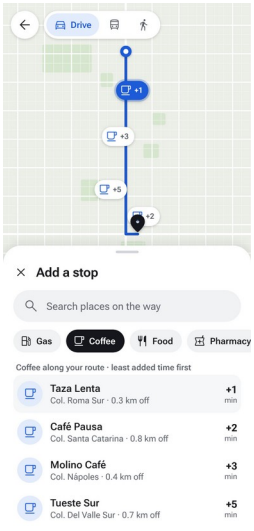

- **Confusing moments?** The original destination turns into stop A, and the order changes the trip by 35 minutes with no hint.
- **What would I change?** Put “Add stop” inside the route sheet, show the minutes each place adds, place the stop automatically and use Undo instead of Done.

Design proposal:

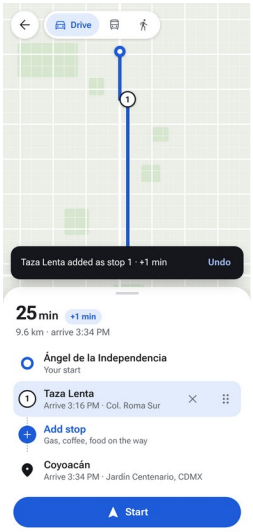

A. Route

“Add stop” is a row inside the route list, within thumb reach.

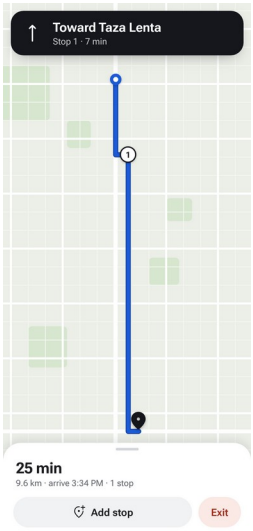

B. Add a stop

Categories along the route. Every place shows the minutes it adds.

C. Placed

The stop goes where it adds the least time. Undo replaces Done.

D. During the trip

The same “Add stop” sheet opens while navigating.

This new UX is easier to find and faster to use. It takes just 2 steps: **Add stop → Tap a place**

Proposed flow: Directions → Add stop → Pick a category or search → Tap a place → Start

Interactive prototype: marcoflesh.github.io/Labs/lab02

	Current	Proposed
Actions to add one stop	5 to 6	**2**
Where the option is	Cut-off button, or ⋮ menu → Edit stops	**A row inside the route list**
Time each place adds	Only the total, after choosing	**On every result, before choosing**
Where the new stop lands	After the destination	**Where it adds the least time**
Fixing the order	Drag by hand, no hint of the fastest order	**Automatic; dragging is optional**
Confirmation	Done	**Changes apply live, with Undo**

Justification

The current flow has the feature but hides it behind a cut-off button and a generic menu, and it makes the user fix the order by hand. Moving “Add stop” into the route list puts it where the thumb already is, so the feature is visible without exploring. Showing the minutes each place adds turns a blind choice into an informed one, and inserting the stop in the fastest position keeps the original destination at the end and removes the need to drag. Replacing Done with Undo keeps the user in control without an extra confirmation. Categories like Gas, Coffee and Food let the user recognize instead of type, and the same sheet works before and during the trip. The result is 2 steps instead of 5 to 6, with less cognitive load and fewer chances of ending up with a slower route by accident.
